

Comprehensive User Guide to Secure Sensitive Data

1. Introduction of the Tool

Sensitive Data Locker is a software application designed to provide robust solutions for encrypting and decrypting sensitive data, ensuring that your personal and professional information is protected from unauthorized access. This tool was developed to meet the growing need for cybersecurity in an increasingly data-driven world. The tool aims to enable users to easily and effectively protect their important files and documents, through a simple and straightforward user interface.

The tool relies on strong encryption algorithms to ensure data confidentiality, and provides features such as user management and activity logging, making it suitable for both personal and professional use. The tool is designed to be easy to use, even for users who don't have a deep technical background in cryptography, while providing a high level of security.

The tool has two main tabs: "Data Lock" to encrypt files, and "Data Decryption" to decrypt them. The tool also provides a feature to verify authorized users, which adds an extra layer of security to access encrypted data.

2. Operating Requirements

To run the Sensitive Data Lockout Tool, you must meet the following requirements on your operating system:

Operating System:

- Windows 10 or later (including Windows 11).

3. User Manual

3.1. Data Security (Encryption)

This tab is for encrypting files, and it has clear controls to make the process easier. When you open this tab, you'll see the following interface:

Explain the widgets and how to deal with them:

1. "Set Access Permissions" section:

This section contains fields for managing user permissions. You can select the type of permission (such as "Manager"), add a new username and password , or remove certain permissions.

Manager: Assign who can access field: Allows you to specify who has certain permissions.

"Add Permission" button: It is used to add the user's specific permission to a new username and password such as (Hossam & 123)

Remove Permission button: Used to remove permission from the user.

Note/ There is a button in the right corner of the screen to switch the language between Arabic and English that can be used as needed.

2. The "Add New User" pop-up window:

- This window appears when you need to add a new user to the system. Requires entering your username and password.
- Username field: Enter your new username here.
- Password field: Enter the password for the new user here.
- "Save" button: Used to complete the process of adding a new user.

3. "Encrypt Data" section:

This is the main section of file encryption.

File Path field: Displays the full path of the file chosen for encryption.

Browse button: Click this button to open the file browsing window and choose the text file you want to encrypt.

'Encrypt' button: After selecting the file and entering the encryption key (if any, the data code), click on this button to start the encryption process. The encrypted file will be saved in the same path as the original file with the 'extension' added.ency`.

3.2. Data Decryption

This tab is for decrypting files that have been encrypted using the tool. When you open this tab, you'll see the following interface:

Explain the widgets and how to deal with them:

1. "Identify Authorized Person" section:

- This section is used to verify the identity of the user authorized to decrypt.
- Username field: Enter your username here.
- Password field: Enter your password here.
- Verify button: Click this button to verify your username and password.
- The tool will encrypt the file and generate a key ('.key') with the same name as the original file (example: 'document.docx.key'). This key is necessary for decryption and must be kept safe.

- The access permissions you specified with the key will be stored in the tool's internal database.

Note: Your permissions must match the permissions specified for the encrypted file.

2. Decryption section:

- Click on the 'Browse' button to choose the encrypted file (which usually ends with '.encrypted').
- View and Decrypt Button: This button provides a convenient function to decrypt the file and view its contents immediately after decryption. When clicked, the app will decrypt the file and view its contents in a pop-up window and decrypt without displaying Click the "Decrypt" button: Click on this Decrypt button. The decrypted file will be saved in the same path as the encrypted file with the extension added.dec`.
- Very important note: Zooming in on the interface ensures that all the details are displayed fully and all elements are displayed correctly.
- If your permissions are correct, the tool will decrypt the file and save it to the same original folder (with a suffix removed'.encrypted').

4. Additional Information

- User management: The tool includes a user management platform, allowing multiple accounts to be created and their roles defined (such as administrator and regular user). This adds an extra layer of security to control who has access to encryption and decryption functions.
- Activity Log: The tool logs all important operations (e.g. login, encryption, decryption) in the activity log. Administrators can review this log to track the tool's usage and detect any suspicious activities.
- Compatibility: The tool is designed to be compatible with major operating systems (Windows, macOS, Linux) when run from the source code. Executables are specific to the operating system on which it is built.
